News from Copilot e M365

Search summarization with Copilot in Edge

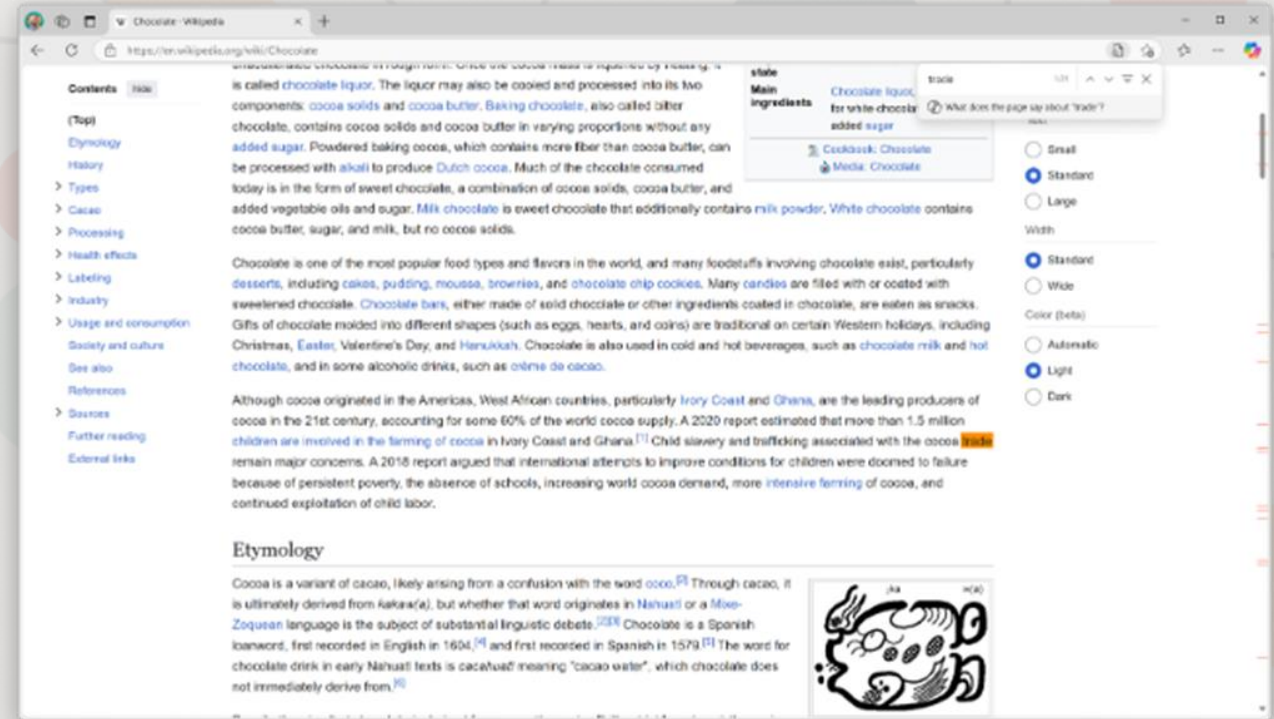

Microsoft Edge now leverages Copilot to help users find information on webpages more efficiently.

When you press **Ctrl+F** and search for a term on a page, Edge can prompt Copilot to **summarize all sections where that term appears**

The summary will appear in the side pane alongside their original page content.

This feature is [rolling out in June](#).

Search summarization with Copilot in Edge

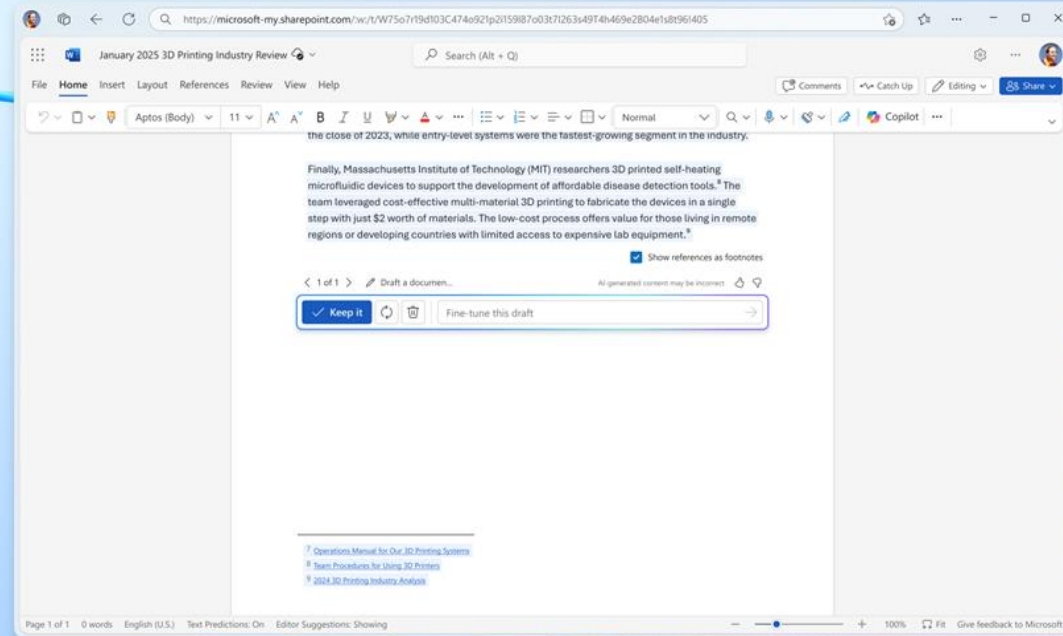

Citations with Copilot in Word

When users are drafting content that's based on referenced sources, Copilot will include citations in the text it generates.

This simplifies the experience for users to build documents by indicating references to information in the content.

This feature is rolling out in June.

Citations with Copilot in Word

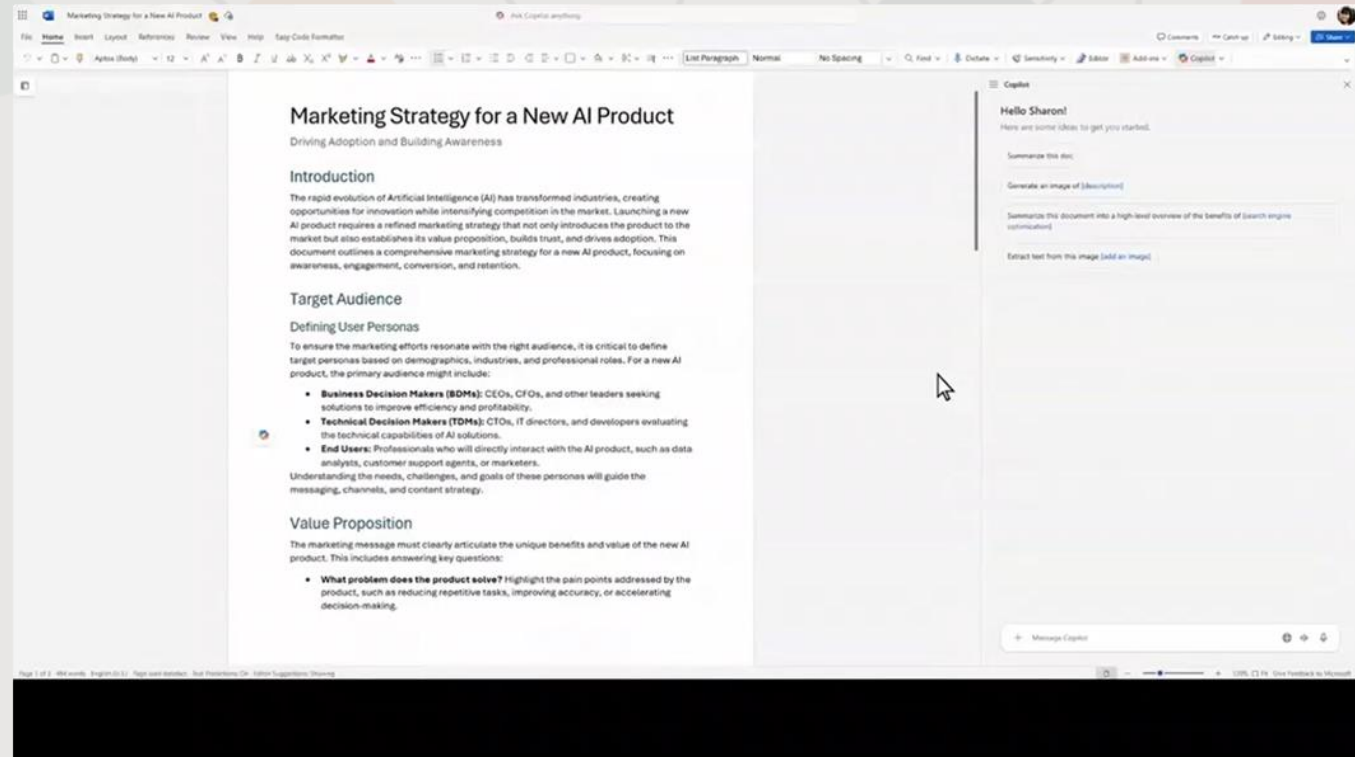

Voice with Copilot in Word

Users can now have a **conversation with Copilot via voice** while working in Word.

By speaking naturally, you can ask Copilot questions about the document ("Summarize this section," "What are the key points?", etc.), inquire about specific details, or even ask for clarifications – all **hands-free**

This feature rolled out in Word on web and Windows in May, and is rolling out in PowerPoint on web and Windows only in the US in June.

Voice with Copilot in Word

Copilot Chat: *Recurring Prompts & Workflow Automation*

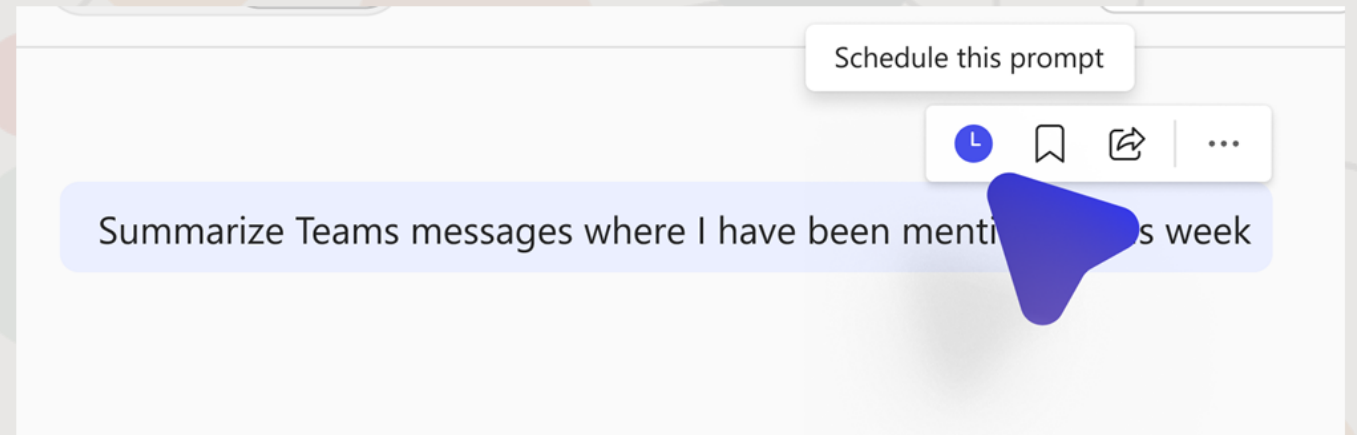

Recurring Prompts & Workflow Automation – Users can now save their frequent Copilot queries as **recurring prompts** or tailored workflows

Users can now easily automate their most frequent queries with just a few clicks.

New options include setting up recurring prompts, tailoring prompts to a user's workflow, and managing their prompts directly in Copilot Chat.

This feature [rolled out in May](#).

Expanded functionality of Copilot Chat

Altre news

- Starting June 2025, interactive agents will be available in meetings and 1-on-1 calls, enabling seamless, AI-powered collaboration.
- Copilot in Excel now intelligently infers the relevant table or data range based on your query, enhancing usability. Additionally, it visually highlights the inferred data for clarity.
- Custom Dictionary for Teams Transcripts
- Microsoft 365 Copilot API: A suite of enterprise-ready APIs that enable developers to build fast, context-aware, secure and generative AI (GenAI) experiences with Microsoft 365 data – powered by retrieval, chat and compliance capabilities.

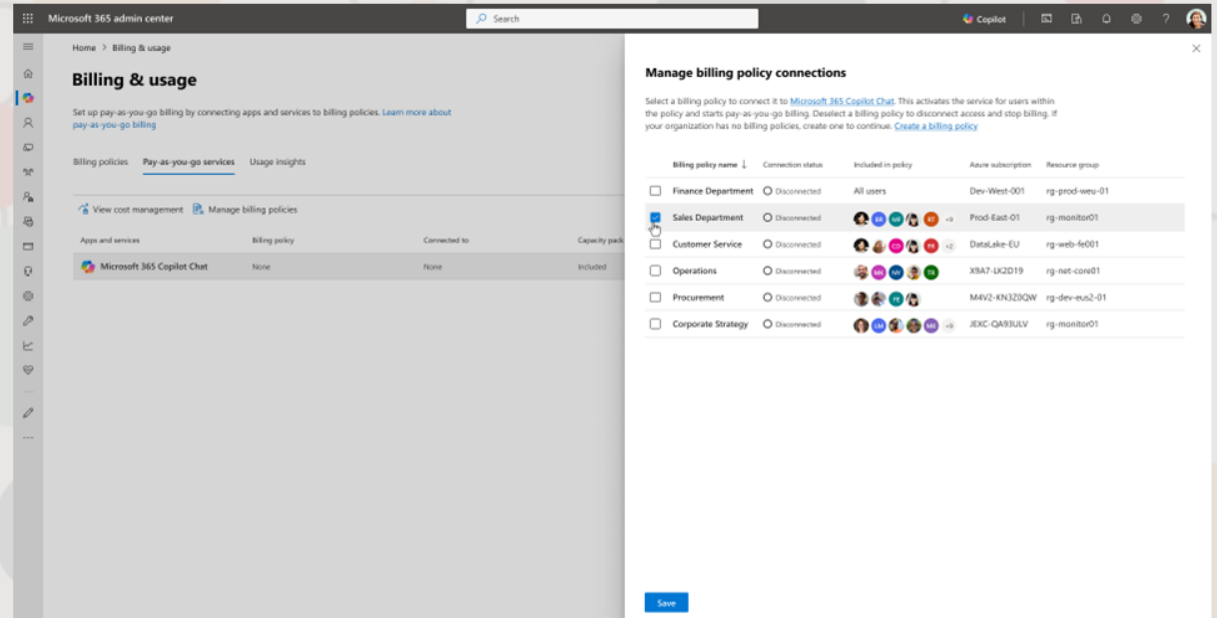

Enhancements to billing and usage: Flexible, transparent, accountable

To support flexible deployment, Copilot Control System introduces pay-as-you-go (PAYG) group-level billing for agents in M365 Copilot Chat.

Soon, AI admins can:

- Enable PAYG at the group level using Azure subscriptions.
- Set budget thresholds and receive alerts for high usage.
- Enforce soft or hard spending limits to prevent overages.
- Monitor message consumption and cost trends in near real-time.
- This model ensures that organizations only pay for what they use, while maintaining full visibility and control over agent usage expenses by departments and user groups. This feature is rolling out in May.

Enhancements to billing and usage

The screenshot shows the Microsoft 365 admin center interface. The main pane displays the 'Billing & usage' section with tabs for 'Billing policies', 'Pay-as-you-go services', and 'Usage insights'. The 'Pay-as-you-go services' tab is active, showing a table with columns for 'Apps and services', 'Billing policy', 'Connected to', and 'Capacity pack'. A table row is visible for 'Microsoft 365 Copilot Chat'.

The modal window 'Manage billing policy connections' is open on the right. It contains a table with columns: 'Billing policy name', 'Connection status', 'Included in policy', 'Azure subscription', and 'Resource group'. The table lists several departments and their associated billing policies.

Billing policy name	Connection status	Included in policy	Azure subscription	Resource group
Finance Department	Disconnected	All users	Dev-West-001	rg-prod-west-01
Sales Department	Disconnected	All users	Prod-East-01	rg-monitor01

Resharing to external users required after enabling Microsoft SharePoint integration with Microsoft Entra B2B

Summary

Resharing to external users is required after enabling Microsoft SharePoint integration with Microsoft Entra B2B. Effective July 1, 2025, previously shared links will no longer work, and external users must be re-invited. Notify users, update documentation, and plan for MFA registration. Learn more <https://learn.microsoft.com/sharepoint/sharepoint-azureb2b-integration>

Effective July 1, 2025, external users will no longer be able to access files, folders, or sites via links that were shared before your organization enabled SharePoint and OneDrive integration with Microsoft Entra B2B.

How this will affect your organization:

This change only impacts organizations that have already enabled or plan to enable SharePoint and OneDrive integration with Microsoft Entra B2B.

After integration, all new external sharing will use Microsoft Entra B2B Invitation Manager. Previously shared links that used the SharePoint One-Time Passcode (OTP) will no longer work. External users attempting to use these older links will encounter the error message "Sorry, something went wrong. This organization has updated its guest access settings. To access this item, please contact the person who shared it with you and ask them to reshare it with you."

Impact to end users:

External users will lose access to content shared via SPO OTP links created before Entra B2B integration. To restore access, users must reshare the file, folder, or site with the intended external collaborators. If the original sender is unavailable or lacks permission, another authorized user must reshare the content. No changes are required to the sharing process—users can continue to share content as they always have.

TECHNICAL DETAILS

GO BACK TO SITE

SharePoint: Site Attestation Policy – Private Preview

The Site Attestation Policy, currently in private preview, is a new addition to the site lifecycle management toolkit.

This policy assigns responsibility for site reviews to site owners, helping prevent sites from becoming inactive or ownerless.

It requires owners or admins to regularly verify key details—such as site purpose, ownership, membership, permissions, and sharing settings—at configurable intervals.

If no action is taken within three months of a review notification, automated enforcement measures like site archival or setting the site to read-only may be applied.

Authenticate to Microsoft Entra ID using Application Identity

Microsoft Entra Connect currently uses a **username and password** for the connector account to sync identities from Active Directory to Entra ID.

To improve security, Microsoft is introducing **application identity authentication** using **OAuth 2.0 client credentials with a certificate**.

This requires creating a **single-tenant app** in Entra ID and choosing a supported **certificate management method** for authentication.

Entra Connect: Fully Managed Application

Microsoft Entra Connect can fully manage the application and certificate, including creation, rotation, and deletion.

The certificate is stored in the Current User store.

For best security, a TPM (Trusted Platform Module) is recommended to protect the private key with hardware-based isolation.

If TPM isn't available, Entra Connect uses software-based key protection with a non-exportable key, though this is less secure.

This managed certificate option is the default in Entra Connect Sync version 2.5.3.0 and above, and Microsoft recommends using it for automated and secure certificate handling.

<https://learn.microsoft.com/en-us/entra/identity/hybrid/connect/authenticate-application-id>

Microsoft 365 Local

It's not Microsoft 365 in the cloud.

It's a special deployment model where key Microsoft productivity workloads (like Exchange Server, SharePoint Server, and possibly Teams components) are run entirely in your own datacenter, but:

- With Azure-like architecture and automation
- Managed locally, not by Microsoft
- Designed for sovereign, disconnected, or highly regulated environments (e.g. finance, healthcare, defense)
- A reference architecture from Microsoft for deploying Exchange/SharePoint in a private environment
- Azure Local as the foundation: Azure-based infrastructure that runs locally, giving you modern VM/container management tools
- Options for local identity, encryption, and compliance controls using Microsoft security models
- No internet dependency supports disconnected or air-gapped environments

Now, organizations can have the best of both worlds: the familiarity and flexibility of Microsoft 365 and Azure, with total control in sensitive environments.

SharePoint Alerts retirement

SharePoint Alerts are a legacy feature in SharePoint that allow users to receive email notifications when content changes in a list or library.

Users attempting to create new alerts will encounter banner warnings and be blocked.

After expiration starts in October 2025, a banner in both the Alert settings page and alert emails will guide users to extend or re-enable alerts manually (max 30-day extensions)

Recommended Action

- Plan to migrate existing alert-based processes to Power Automate or the newer SharePoint "Rules" feature
- Use the Microsoft 365 Assessment tool to scan for current alert usage and identify sites still leveraging alerts

<https://support.microsoft.com/en-us/office/sharepoint-alerts-retirement-813a90c7-3ff1-47a9-8a2f-152f48b2486f>

Connector for Active Directory - MSA

Today, Windows Autopilot uses the Intune Connector for Active Directory to deploy devices that are Microsoft Entra hybrid joined.

To strengthen security in our customers' environments, we've updated the Intune Connector for Active Directory to use a Managed Service Account (MSA) instead of a SYSTEM account.

By late May 2025: Switch to the new MSA-based connector to maintain new enrollment capability.

By late June 2025: Complete migration — the old connector will be fully unsupported and unavailable.

Summarize your presentation with Copilot in PowerPoint

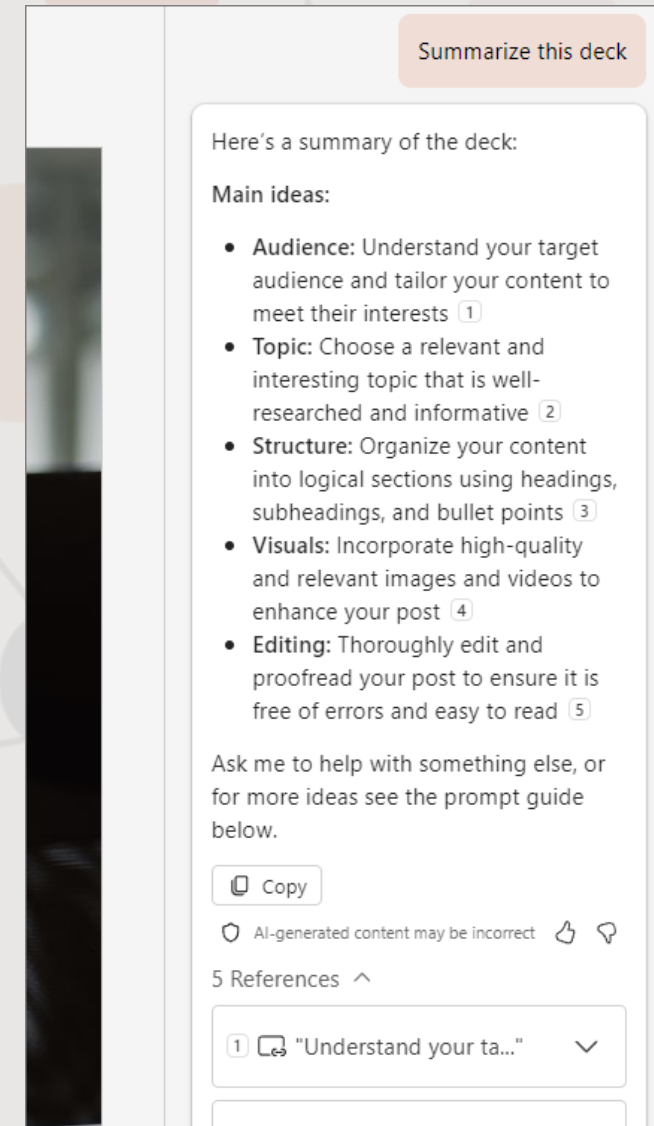

This feature is available to customers with either a Microsoft 365 Copilot (work) or Copilot Pro (home) license.

Copilot in PowerPoint can read through the presentation and give you a bulleted summary so you can understand the key points.

- Select the **Copilot** button from the ribbon.

The Copilot pane opens on the right side of your screen.

- Type Summarize this presentation in the prompt field and send it.

Microsoft Teams: New threaded conversation layout option for channels

Summary

Microsoft Teams is introducing a new threaded conversation layout for channels, allowing users to reply to specific messages and start threads in a side pane.

This feature will roll out from late June 2025 to late August 2025.

Admins can manage this setting via the Teams admin center.

Coming soon to Microsoft Teams channels:

A new threaded layout similar to group chats. Before this rollout, channels have a Post reply layout option only.

After this rollout, the threaded layout will encourage immediate back-and-forth communication in channels. In threaded layout channels, users can reply to specific messages and start a thread in the side pane. Threads allow users to have side conversations while keeping the main conversation without cluttering the main conversation.

This message applies to Teams for Windows desktop, Teams for Mac desktop, Teams for the web, and Teams for iOS/Android.

This message is associated with Microsoft 365 Roadmap ID [488300](#).

Microsoft Teams: apply partial settings for Android devices

From July, you'll be able to apply configuration profile settings to Microsoft Teams Rooms on Android, Teams Panel and Teams Phones without overwriting settings set locally on the device.

For instance, if you set a time zone or language at the device level and want to apply other bulk changes such as custom background, or specific Teams Rooms settings like auto share or apply QR code.

You can build a single configuration profile with all the common settings for all devices in the estate and leave local settings like time zone as "not configured".

Applying the config profile will set everything else and leave the local setting alone. Great for multi-national room deployments.

Microsoft Teams: Apply partial settings for Android devices using configuration profiles in the Teams admin center

Microsoft Teams

IN DEVELOPMENT

ROLLOUT START
July 2025

In the Teams admin center, admins can now modify, review, and apply configuration settings to Android devices without overriding other settings ensuring only the desired changes are made.

Microsoft Teams: remote collection of diagnostic logs

New capability coming to Teams Admin Center in July - remote collection of diagnostic logs from users' Teams clients on Windows and Mac.

- Logs can be collected without user action, streamlining troubleshooting without disrupting user experience.
- Logs may contain user-specific data and could be subject to data privacy considerations and rights requests.

Admin Impact Medium

User Impact Low

Release Start 30 Jun 2025

Release End 31 Jul 2025

ChangePilot Summary:

- New capability in Teams Admin Center for remote collection of diagnostic logs from users' Teams clients on Windows and Mac.
- Admin roles that can use this feature include Teams Administrator, Teams Communications Administrator, and Teams Communications Support Engineer.
- Logs can be collected without user action, streamlining troubleshooting without disrupting user experience.
- Important to update internal documentation and ensure only authorized admins have access to this capability.
- Logs may contain user-specific data and could be subject to data privacy considerations and rights requests.

Microsoft Teams: Monitor DNS resolution failures and impact of proxy on Teams meetings with Best practice configurations dashboard in Teams admin center

Microsoft Teams Roadmap Item 492982
GA date: July CY2025

Teams administrators can use the Best practice configurations dashboard in Teams admin center for monitoring significant impact on meeting quality in their tenant due to DNS resolution failures or proxy (local or cloud)

June 2025

Microsoft Teams

Personalize your Teams phone experience by setting unique ringtones and choosing how each line key alerts you—ring only, ring with flash, or flash only. This feature is supported across touch, non-touch, and sidecar devices, giving you full control over how you stay notified

Microsoft Teams: Introducing the Network Strength Indicator

Microsoft Teams is introducing a **Network Strength Indicator** feature that displays a 3-bar system to show internet connection quality during meetings, with rollout starting in late August 2025 for early adopters and full availability by mid-September 2025.

Teams is getting a Network Strength Indicator

- Microsoft is adding a new **Network Strength Indicator** with suggestions to help connectivity
- Simple 3-bar system:
 1. Bad (1 bar)
 2. Poor (2 bars)
 3. Good (3 bars)

- View your own and others' connections
- Due late June to mid-July 2025
