News from Copilot and M365

Change update channel of Microsoft 365 Apps to enable Copilot

To use Microsoft Copilot, Microsoft 365 Apps must run on Current or Monthly Enterprise Channel.

Devices currently configured for Semi-Annual Enterprise Channel receive the same feature and security updates as devices on Monthly Enterprise Channel, beginning with the Version 2606 update release.

After Version 2606 or later is installed, devices show as Monthly Enterprise Channel in Microsoft 365 Apps experiences, including the File > Account backstage view.

Users are not expected to experience workflow changes as a result of this change.

Existing Microsoft 365 Apps continue to update through their configured management process.

The first update will be larger than a typical monthly update, depending on the device's current build. Updating from version 2508 to 2606 will be roughly 1.6 GB. After the transition, future updates are expected to follow the normal Monthly Enterprise Channel cadence and size.

Devices with users that meet Microsoft Copilot requirements will become eligible for Copilot after the update because they are on the Monthly Enterprise Channel experience.

Copilot - Microsoft Purview: Data Lifecycle Management – Retention for Copilot Memory

Microsoft Purview: Data Lifecycle Management – Retention for Copilot Memory

IN DEVELOPMENT

ROLLOUT START
September 2026

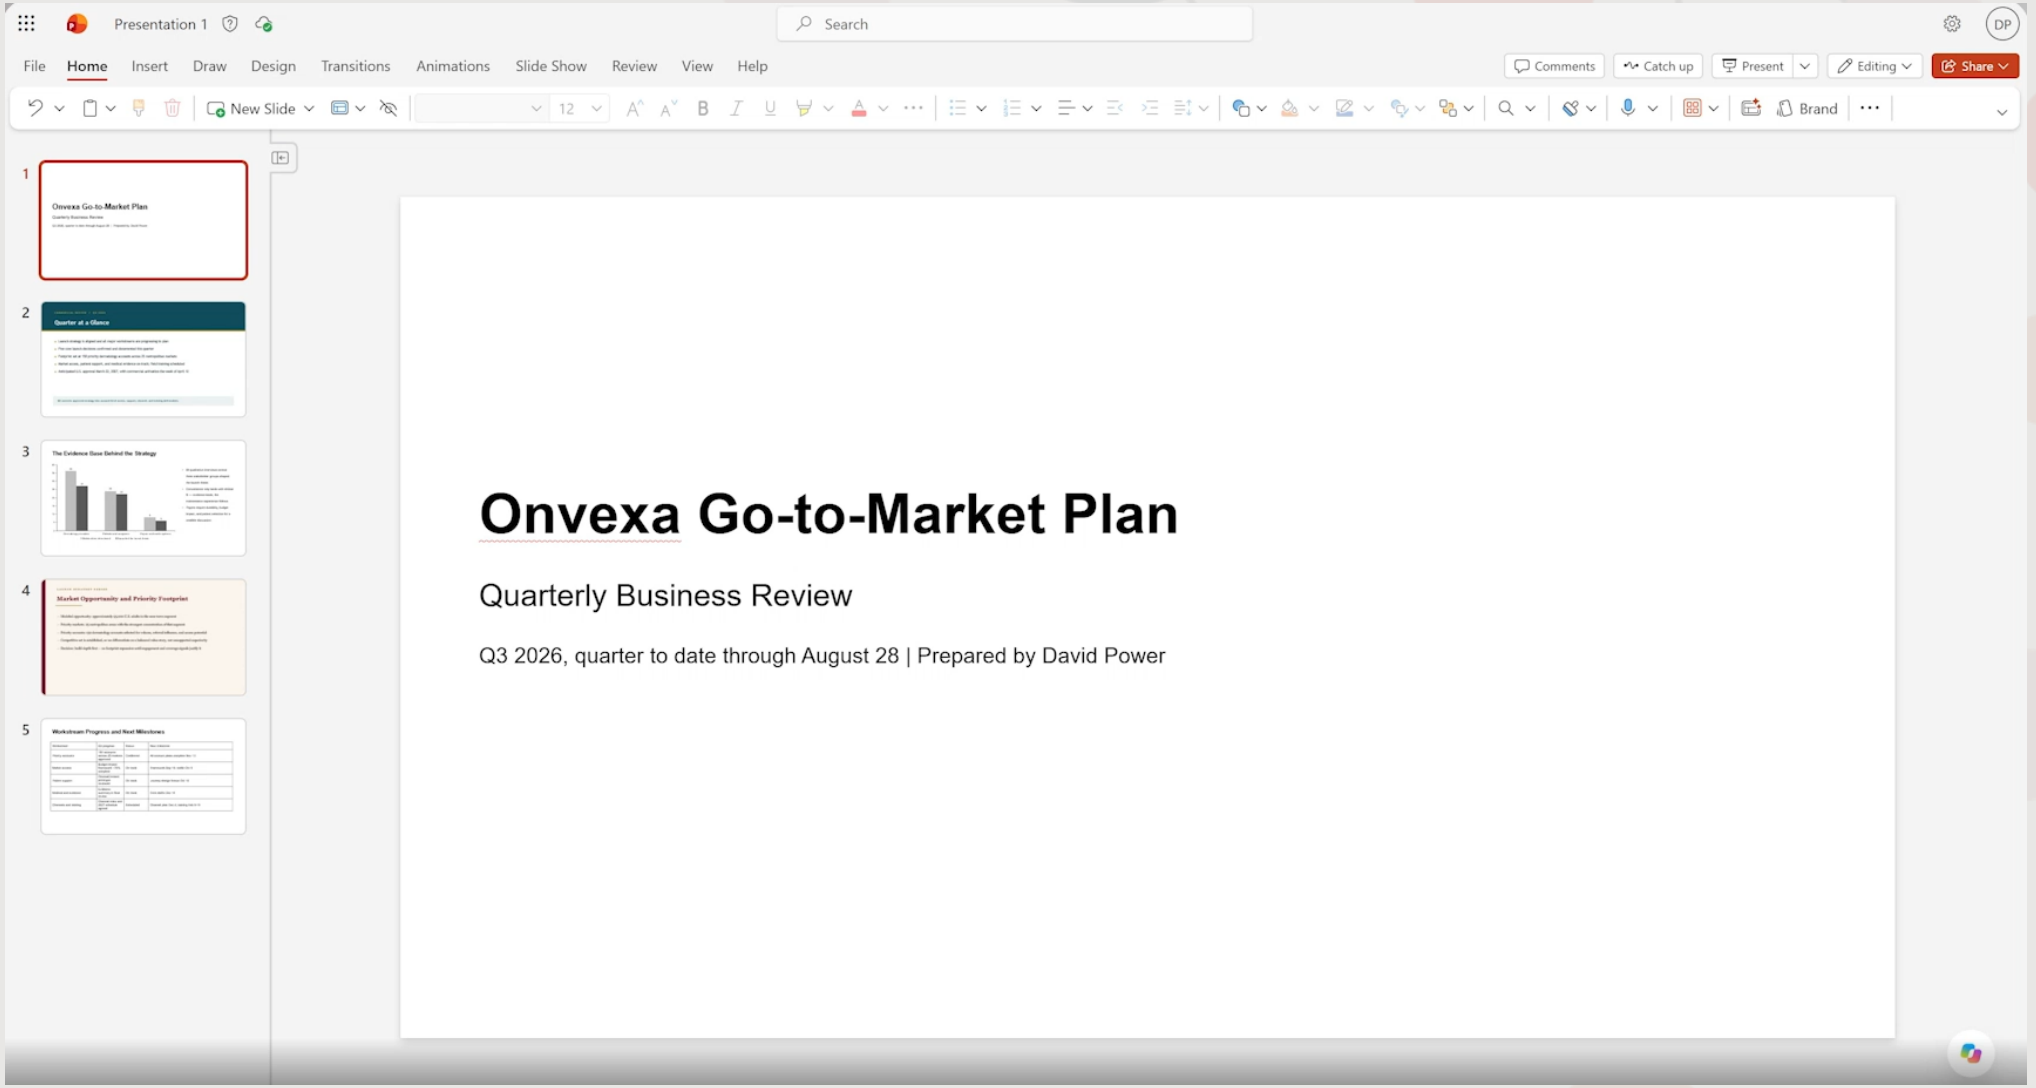

Microsoft Purview

Configure retention for Microsoft 365 Copilot memory to help preserve historical versions of memory items for security, compliance, and investigation scenarios. Copilot memory includes saved memories and details inferred from chat history that enable more personalized and context-aware Copilot experiences. Copilot memory items are stored in a hidden folder in the user's Exchange mailbox. This capability will enable retention and versioning support for inactive memory items so that administrators can maintain visibility into memory changes while active memory continues to be managed by the Copilot experience.

Microsoft Entra Connect Sync: mandatory upgrade

Sync stops on 30 September 2026 on any server below version 2.5.79.0

Official Microsoft requirement, published as a mandatory upgrade notice on the Entra Connect Sync installation prerequisites and version release history pages.

What is happening

Backend service hardening

Microsoft is changing the backend connection and authentication mechanism for the Microsoft Entra AD Synchronization Service.

Hard cutoff

Versions before 2.5.79.0 (released May 2025) lack the client-side code for the new endpoint. Once the backend switches over on 30 September, older servers stop syncing completely:

- New user additions
- Password hash updates
- Account deprovisioning

Key action items and risks

1 Don't stop at 2.5.79.0: the minimum floor trap

2.5.79.0 keeps sync running after 30 September, but under the 12-month support policy it reaches end of support on **23 October 2026**, just three weeks later. Upgrade to the latest stable release (**2.6.x or later**) from the Entra admin center.

2 Check Cloud Sync eligibility

Microsoft recommends evaluating Entra Cloud Sync: lightweight on-premises agents, automatic updates and all new sync features. Eligible tenants (standard AD objects, multi-forest without heavy custom attribute filtering) avoid future server-based maintenance.

3 Upgrade Entra Connect Health agents

AD DS, AD FS and Connect Sync health agents must be on build **4.5.2466.0 or later** by 30 September 2026.

Defender for Endpoint: AI agent runtime protection

Inspects what AI coding agents do on the device in real time, closing a gap that file-based antivirus can't see

What it does

1 Discovers local AI agents

Gives security teams visibility of the AI agents and MCP servers running on endpoints, especially developer devices.

2 Inspects the agent loop in real time

Examines agent activity as it happens (shell commands, file changes, web queries) instead of waiting for a malicious file to reach the disk.

3 Covers the tools developers use

GitHub Copilot CLI and MCP servers, extended to Codex CLI, Claude Code and IDE extensions.

Why it matters

Coding agents now run shell scripts, modify files and query the web on their own. That opens a gap traditional antivirus misses: **indirect prompt injection**, where a web page or repository file tells the agent to read .env secrets or run terminal commands.

Runtime protection sits inside this loop

Agent execution is inspected as it happens, without waiting for a malicious file to hit the disk.

Status: Public Preview · runs on standard production engine update channels (no Beta channel needed)

Intune deployment plans: staged rollouts

Blast-radius control for apps and policies: pilot, observe, expand, with a human approval gate on top

How a deployment plan rolls out

Admin creates deployment
App or policy

→

Second admin approves
Optional: Multiple Admin Approval

→

Ring 1: IT / pilot
Mon: 20 IT test devices

→

Ring 2: early adopters
Wed: 100 pilot users

→

Ring 3: general users
Next Mon: 25% of production

→

Ring 4: everyone
Following week: all remaining

Governance gate before anything ships

Wait and observe between rings: problems surface in Ring 1, not across 5,000 devices

Control over timing

You decide when the rollout moves to the next ring, without manually changing assignments each time. Ideal for disruptive changes: **Defender settings, security baselines, Windows configuration and app updates.**

Multiple Admin Approval

High-impact deployments can require a **second administrator's approval** before any ring starts, so no single admin can push an accidental or malicious change across the estate.

RBAC and scope tags still apply

Staged rollout doesn't bypass the permission model. Admins can still only deploy to the **policies, devices and business units** their roles and scope tags allow.

Intune Deployments: what's actually new

Public Preview · *Devices > Manage devices > Deployments* · *rings aren't new, native orchestration of them is*

Before vs now

BEFORE

Do-it-yourself rings

Entra groups, separate assignments or policies, filters, or Windows Update / Autopatch. Each wave meant changing assignments by hand.

NOW

Intune-native orchestration

Take an existing app or policy and roll it through defined rings with scheduled delays. Intune adds the assignments as each ring activates.

Example: a reusable deployment plan

Pause, resume or cancel the progression at any point.

Save the ring structure as a **Deployment Plan** and reuse it for future deployments.

Supported during Public Preview

Windows 10/11 policies

Settings Catalog · Endpoint Security

Microsoft OneDrive: New pay-as-you-go storage billing option

Archive Share Copy link Mark as unread

Summary

Microsoft OneDrive introduces a pay-as-you-go storage billing option, allowing admins to let selected accounts exceed licensed storage quotas with automatic usage-based billing. Public preview is available now; general availability starts November 2026. No action is required unless opting in. Compliance impact is minimal.

Is this summary helpful?

What and why

We are introducing a pay-as-you-go, consumption-based billing option for additional OneDrive storage. This capability gives administrators more flexibility to manage storage growth by allowing selected OneDrive accounts to exceed their licensed storage quotas when needed, while helping organizations control which users can consume additional storage beyond their licensed storage quotas. Pay-as-you-go storage is currently in public preview for commercial tenants.

Rollout schedule

- **Public Preview (Worldwide):** The public preview of this feature is available now to all commercial tenants.
- **General Availability (Worldwide, GCC, GCC High, DoD):** Rollout begins in early November 2026 and is expected to complete by early December 2026.

Microsoft Purview: Data Lifecycle Management – Archive SharePoint files under retention

IN DEVELOPMENT

PREVIEW AVAILABLE
September 2026

ROLLOUT START
October 2026

Microsoft Purview

We are introducing file archiving support in SharePoint Online, utilizing this feature administrators can seamlessly include archiving actions within their existing data retention policies. This means that, in addition to keeping or deleting data, admins can now leverage Purview DLM to archive files according to organizational requirements, ensuring comprehensive governance across all stages of the content lifecycle in SharePoint Online. Retention based file archiving moves inactive content to low-cost storage, lowering costs with no compromise on Compliance, keeping data discoverable and making Copilot results highly relevant.

SharePoint AI is released in GA (rollout starts October 2026)

- **Included with the Copilot license**: asking questions about your content, creating and organizing content, creating and using Copilot skills, extracting AI-generated metadata, and using deterministic workflows.
- **Copilot Credits are required for large-scale**, multi-step work across big content.
- **New advanced capabilities also use Copilot Credits**: image generation and editing in libraries and sites, AI-generated site analytics reports, and near real-time metadata autofill.
- You are **prompted to confirm before any Copilot Credits** are consumed.

- Copilot Credits **require usage-based billing**. Admins control access through spending policies in the Microsoft 365 admin center.

Ritiro delle Microsoft 365 Comanion apps

Retirement of Microsoft 365 Companion apps

Archive Share Copy link Mark as unread

Summary

Microsoft 365 companion apps (Calendar, People, Files) will retire on December 16, 2026, ceasing support and functionality. Admins must stop new installations and remove existing apps. Core Microsoft 365 features remain unaffected, accessible via Outlook, Teams, and other tools. Users should be informed and guided accordingly.

Is this summary helpful?

What and why:

The Microsoft 365 companion apps—Calendar, People, and Files — are taskbar-integrated apps designed to streamline everyday workflows, helping users stay focused, reduce context switching, and complete tasks faster.

We are retiring the companion apps, and they will no longer function or be supported after 16. December 2026. We advise admins remove the apps from devices in their tenant by this date. Detailed admin guidance is in Microsoft 365 companion app retirement.

MAJOR UPDATE ADMIN IMPACT RETIREMENT USER IMPACT

Retirement and breaking changes guide for Azure Communication Services

Microsoft has announced a major evolution of **Azure Communication Services**, with standalone ACS retiring on **September 30, 2028**.

🔄 **What is changing?**

Several standalone ACS capabilities are being **retired**, including:

- Email
- SMS
- Advanced Messaging with WhatsApp
- Chat
- Rooms
- Direct Routing
- PSTN Number Management
- Job Router
- Web and Mobile UI Library SDKs

Other capabilities will remain available but introduce **breaking changes**, including:

- Voice & Video Calling SDK
- Call Automation
- Call Diagnostics
- Call Recording
- Audio Streaming
- Closed Captions

For these scenarios, applications will need to move toward supported **Teams-aligned services**, including **Teams Phone Extensibility**, **Teams Meeting Interoperability**, and **Teams Click-to-Call for Teams Voice Apps**.

🎯 **For Dynamics 365 Contact Center customers, this is particularly important.**

The migration recommendations point to:

☎️ **PSTN / Direct Routing → Teams Phone Extensibility / Teams Phone**
💬 **WhatsApp → Dynamics 365 Contact Center**
🔀 **Job Router → Dynamics 365 Contact Center**

Existing ACS customers have a transition period, but **beginning October 23, 2026, new customers can no longer sign up for retiring ACS services**.

https://learn.microsoft.com/en-us/azure/communication-services/acs-retirement-and-breaking-changes-guide

Microsoft Teams is adding QR code protection for messages from external users

QR code images received from external senders will be blurred by default. Users can reveal the image when they trust the sender.

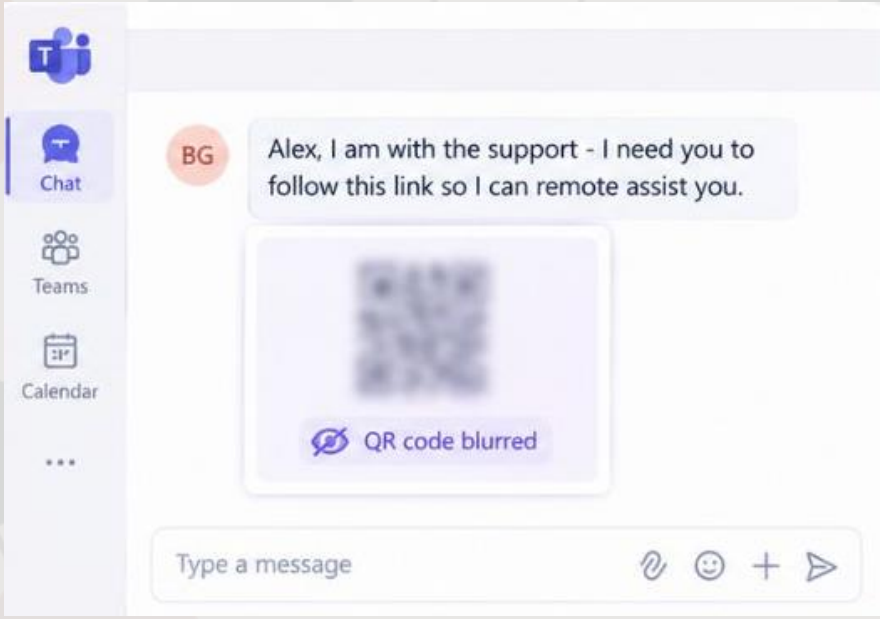

This is particularly relevant for organizations with external access enabled in Teams, since users regularly receive messages and files from people outside the tenant.

The admin-side work is mostly around communication:
- Let users know that QR codes from external users may appear blurred.
- Explain that they can reveal the image when they trust the sender.
- Remind them to verify unexpected QR codes before scanning.
- Update help desk documentation if Teams security changes are documented internally.

The feature applies to Teams desktop, web, and mobile.

Microsoft is targeting early October 2026 for Targeted Release and mid-October for Worldwide GA.

Teams **personal message reminders**

Microsoft Teams is finally bringing personal message reminders directly into chats and channels, starting October 2026, it felt like a big relief.

With this new feature, we'll be able to:
👉Set a personal reminder directly on a chat or channel message
👉Choose when we want to be reminded
👉Create, update, complete, or delete reminders
👉Manage upcoming, active, and completed reminders from a dedicated Reminders view
👉Receive a notification when a reminder is due

And the part I particularly like: the reminder is completely personal. Other people in the chat or channel won't see that we've set a reminder on a message.

The feature will be enabled by default. So once it becomes available in Teams, users can start using it, and reminders will respect their existing Teams notification settings.

Teams PowerShell 8.0

AI-powered Voicemail Triage
Admins can now manage AI capabilities for personal voicemail on a per-user basis through Set-CsOnlineVoicemailUserSettings, including:
Urgency Detection
Category Detection
Call-to-Action Detection
Voice-to-Text Summaries

Intelligent Recap Controls
CsTeamsMeetingPolicy now includes new settings to manage Intelligent Recap features:
AllowIntelligentRecap
IntelligentRecapDocxFileExpirationDays
EnableExternalRecordingDetection

AI Disclaimers in Auto Attendants
Auto Attendants gained several new parameters, including:
AiDisclaimerType
AiDisclaimerCustomText<

Enhanced Auto-Recording Scenarios
Auto-recording capabilities continue to evolve with:
Support for audio-file announcements in recording templates
Additional controls around recording templates and announcements
New mandatory compliance-related parameters when creating templates
This expands flexibility for regulated industries that require call recording.

More Call Control for Users
User calling settings now support:
BusyOnBusyOption (Busy Signal, Redirect, Ring User)
MaximumConcurrentCalls

Information Protection - Apply default SharePoint library labels to data at rest

Apply default SharePoint library sensitivity labels to data at rest

Purview will get a new auto-labeling policy that applies a SharePoint document library's default sensitivity label to existing files stored in that library. Previously, default library sensitivity labels were applied only to new or modified files. With this update, organizations can extend labeling to historical content, including files that existed before the default library sensitivity label was configured for the site.

Details:

- Auto-labeling will evaluate existing files in selected SharePoint document libraries.
- Files that do not have a sensitivity label applied will receive the library's default sensitivity label.
- Files that existed in a library before the default sensitivity label was configured can now be labeled automatically.
- Files that have a lower-priority sensitivity label applied may be upgraded to the library's default sensitivity label (depending on the policy setting).
- Labeling occurs as a background service process and is not immediate.
- The same default sensitivity label already applied to new or modified files in the library is used for existing files.
- The feature is opt-in and requires administrator configuration.

⚠ One policy of this type can be configured per tenant.

⚠ A maximum of 10 SharePoint sites can be included in a policy.

Insider Risk Management – Policy Recommendation Panel in IRM

Microsoft Purview: Insider Risk Management – Policy Recommendation Panel in IRM

IN DEVELOPMENT

PREVIEW AVAILABLE
November 2026

ROLLOUT START
December 2026

Microsoft Purview

Today, Insider Risk Management (IRM) provides policy-driven protection for data leaks, data theft, and risky AI usage. However, while policy-driven protections are powerful, customers may not always have clear visibility into where coverage can be optimized or expanded to address latent insider risk. IRM now provides guidance on what protections are missing or which policy configurations deliver the most incremental value, providing customers with more comprehensive coverage to mitigate their most critical insider risk. Microsoft Purview Insider Risk Management correlates various signals to identify potential malicious or inadvertent insider risks, such as IP theft, data leakage, and security violations. Insider Risk Management enables customers to create policies based on their own internal policies, governance, and organizational requirements. Built with privacy by design, users are pseudonymized by default, and role-based access controls and audit logs are in place to help ensure user-level privacy.

Microsoft Purview: Data Loss Prevention - Count of Labelled Documents Condition

IN DEVELOPMENT

PREVIEW AVAILABLE
November 2026

ROLLOUT START
December 2026

Microsoft Purview

This release introduces a new condition for Exchange Online policies: "Count of labeled documents is greater than." This condition evaluates the number of attachments in an email message that carry a matching sensitivity label. When the count exceeds a defined threshold, the DLP rule is triggered, and configured actions are applied. This capability enables detection of high-volume data exfiltration scenarios, where multiple sensitive files—individually low-risk—collectively represent a significant compliance or security risk. Existing conditions evaluate file content, but do not provide controls based on the volume of labeled attachments.

Insider Risk Management – Reduce temporary file noise for Endpoint activities in IRM

Microsoft Purview: Insider Risk Management – Reduce temporary file noise for Endpoint activities in IRM

IN DEVELOPMENT

PREVIEW AVAILABLE
October 2026

ROLLOUT START
November 2026

Microsoft Purview

When files are opened in Windows, the operating system, and applications (for example, Microsoft Office and browsers) can create, rename, and delete temporary files as part of normal behavior. The Endpoint client audits these activities, resulting in high-volume, low-signal events that appear as "noise" for Insider Risk Management (IRM) customers. While global exclusions exist (file type, keyword, file path, etc.), some temporary file naming patterns are not easily captured with the current exclusions, leaving customers without a practical way to reduce noise without over-excluding. This feature introduces built-in filtering for well-known temporary file name patterns so that Endpoint file operations are excluded from IRM activity explorer and scoring reducing noise allowing customers to focus on the most relevant alerts. Microsoft Purview Insider Risk Management correlates various signals to identify potential malicious or inadvertent insider risks, such as IP theft, data leakage, and security violations. Insider Risk Management enables customers to create policies based on their own internal policies, governance, and organizational requirements. Built with privacy by design, users are pseudonymized by default, and role-based access controls and audit logs are in place to help ensure user-level privacy.
