Action Required: Trust DigiCert Global Root G2 Certificate Authority for using Entra services by January 7, 2026

Action Required: Trust the new DigiCert Certificate Authorities (CAs) for Microsoft Entra

Starting January 7, 2026, Microsoft Entra will migrate its DigiCert certificates from the G1 root CA to the G2 root CA. Clients that pin to the DigiCert G1 root or do not trust the DigiCert G2 root may experience authentication failures.

What are G1 and G2 root CAs?

Certificate Authorities (CAs) issue digital certificates that establish trust for secure communications. A root CA is the top-level certificate in a trust chain. DigiCert Global Root G1 is the current root CA used by Microsoft Entra services. DigiCert Global Root G2 is the newer root CA that Microsoft is migrating to for improved security and compliance. If your systems do not trust the G2 root, authentication and secure connections to Microsoft Entra services will fail.

Why you're receiving this message:

Our reporting indicates that one or more users in your organization may be using Microsoft Entra ID.

When this will happen:

January 7, 2026.

How this affects your organization:

Who is affected: Organizations using Microsoft Entra ID services.

What will happen:

If DigiCert G2 certificates are not trusted, authentication failures will occur when accessing Microsoft Entra services.

Impacted domains include:

login.microsoftonline.com login.live.com login.windows.net autologon.microsoftazuread-sso.com graph.windows.net

What you can do to prepare: Help and support: Compliance considerations:

Trust all Root and Subordinate CAs listed in the [Azure Certificate Authority details](#) documentation.

Ensure you trust the "DigiCert Global Root G2" root and its subordinate CAs (documented since September 2025).

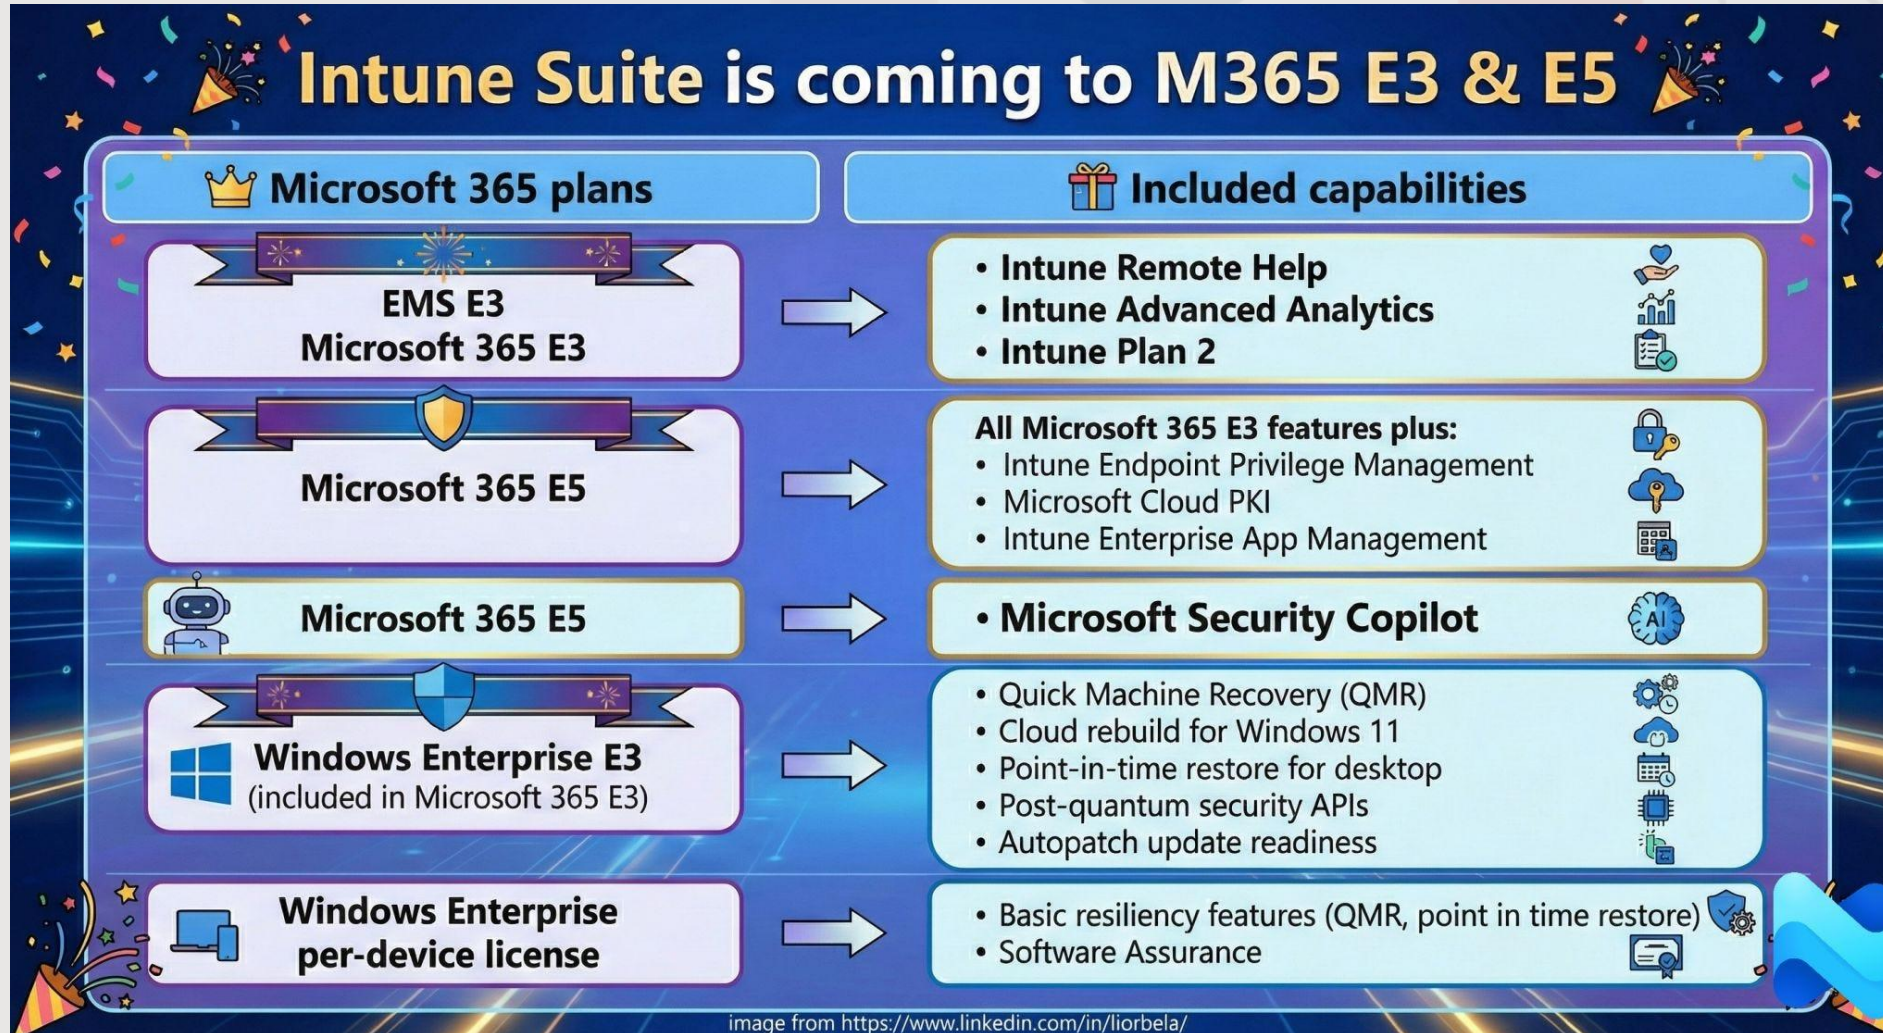

<https://m365admin.handsontek.net/action-required-trust-digicert-global-root-g2-certificate-authority-using-entra-services-january-7-2026/>

Nuove funzionalità nelle licenze Business ed Enterprise: dettaglio Intune

<https://techcommunity.microsoft.com/blog/microsoftintuneblog/microsoft-365-adds-advanced-microsoft-intune-solutions-at-scale/4474272>

Intune Suite Capabilities Are Being Included in E3 & E5

E3 subscribers will automatically get these advanced Intune capabilities in 2026:

- Remote Help: secure help-desk remote assistance
- Intune Advanced Analytics: deeper device health insights and proactive signals
- Intune Plan 2 features : richer compliance, configuration, firmware update support
- Tunnel for Mobile Application Management: secure per-app VPN
- Specialty device management & firmware OTA support: for non-standard/rugged devices

These were previously part of Intune Suite or separate add-ons, meaning more value for E3 without buying

MICROSOFT INTUNE BLOG 7 MIN READ

Microsoft 365 adds advanced Microsoft Intune solutions at scale

Talal Alqinawi  MICROSOFT
Dec 04, 2025

Note: New capabilities will begin to roll out CY26 Q3. Customers will receive a 30-day notice in Message Center before the update becomes available in their tenant.

In the last three years, Microsoft launched multiple endpoint management solutions with advanced capabilities that enable IT professionals to unify mission critical endpoint management functionality in one cost-effective plan with the **Microsoft Intune Suite**. These capabilities are essential to accelerate every organization's journey towards Zero Trust security, improving end user productivity, and empowering IT and security professionals to improve total cost of ownership (TCO).

Today, IT teams face new challenges, as device inventories grow larger, more diverse, and are much more widely distributed and dynamic than just a few years ago. At the same time, they are still expected to keep systems protected, compliant, and operational with limited budgets. To meet evolving security needs and growing demands, organizations need **more advanced security and management tools** capable of transforming IT operations in ways that can safeguard against AI-enhanced attack vectors and new risks while preserving productivity on every endpoint.

To help organizations make this transition, Microsoft is bringing powerful capabilities of the **Microsoft Intune Suite** to **Microsoft 365 E3 and Microsoft 365 E5**. By expanding these offerings, more customers can confidently embrace transformation and stay secure in the age of AI.

Intune Suite Capabilities Are Being Included in E3 & E5

E5 includes everything in E3 above plus even more advanced endpoint tools built into the licence:

- Endpoint Privilege Management: just-in-time elevation and least-privilege controls
- Enterprise Application Management: Microsoft-maintained app deployment and patching features
- Microsoft Cloud PKI: cloud-hosted certificate lifecycle and authentication support
- Security Copilot & AI-driven insights: AI augmented workflows for security and Intune operations (Security Copilot gets deeper integration with Defender, Purview and Intune)

This effectively elevates the base E5 endpoint management capability to be competitive with what only Intune Suite gave before.

About root and issuing certificate authorities (CAs)

A root CA must be created before an issuing CA can be created. When using bring-your-own CA, a root CA is not required in Intune. Multiple issuing CAs can be contained by a root CA in Intune or bring-your-own CA. Only issuing CAs can be used to deploy leaf certificates to devices and users. Strengthening the Baseline Security Capabilities

Microsoft is also strengthening the baseline security capabilities included in existing licences:

- Defender for Office 365 Plan 1 will be included with Office 365 E3 and Microsoft 365 E3, improving protection against phishing, malware, and malicious links
- Safe Links (URL protection) will be extended to Microsoft 365 E1, Business Basic, and Business Standard, raising the minimum security posture across lower-tier plans.
- Security Copilot will be included within Microsoft 365 E5, enabling AI-assisted threat investigation, response, and security operations at scale.

AI and Productivity Enhancements

- Copilot Chat will become natively available within core Office applications including Word, Excel, PowerPoint, Outlook, and OneNote.
- This integration goes beyond simple assistance, introducing an Agent Mode that supports more iterative, multi-step content creation.
- Administrators will also gain improved governance and control options, helping organisations balance innovation with security and compliance requirements.

Global Pricing Update Effective from 1 July 2026

- For organisations with renewal dates in the second half of 2026, this creates a clear window to assess impact, review licensing strategy, and plan accordingly
- Pricing updates Microsoft will introduce a global price increase across Microsoft 365 and Office 365 subscriptions
- From July 2026, nonprofit pricing will be harmonised with commercial pricing, removing the historical differential
- The updated pricing will take effect at the first renewal occurring on or after 1 July 2026, rather than immediately.

Planner will support Microsoft Information Protection (MIP) sensitivity labels

- Microsoft Planner will support Microsoft Information Protection (MIP) sensitivity labels at the content level starting early–mid December 2025 (Roadmap ID 523819).
- This allows organizations to encrypt plans, block copy/print/export, enforce read-only access, and apply visual markings like watermarks directly to Planner content.
- The feature is enabled by default, requires no changes to existing labels, and aligns Planner with Microsoft Purview protections. Admins should review Purview label settings and update user guidance/training.

Anthropic models will be enabled by default in Microsoft 365 Copilot

Coming Soon: Anthropic models will be available by default in Copilot experiences

 Archive  Share  Copy link  Mark as unread

In September, **Anthropic models** became available in *certain Copilot experiences* through an **opt-in setting**, where use was subject to Anthropic's commercial terms and data processing agreement. **On January 7, 2026**, Anthropic models will be **enabled by default for many customers** and now offered under the Microsoft [Product Terms](#) and [Data Protection Addendum](#). To enable this change, Anthropic has been onboarded as a Microsoft subprocessor. This transition extends Microsoft's contractual commitments and data protection standards to the use of Anthropic models in Copilot experiences.

How this affects your organization:

Who is affected:

- Admins managing Microsoft 365 Copilot and Microsoft Copilot Studio.
- Microsoft 365 Copilot licensed customers participating in select Frontier features such as Word, Excel, PowerPoint, and Researcher agents, as well as Agent Mode in Excel.

Key changes

- Dec 8, 2025: New admin toggle for Anthropic models appears in the Microsoft 365 admin center (MAC). For most commercial cloud customers, it will be enabled ON by default (except customers in EU/EFTA and UK will be OFF by default). See "customer and region exclusions" section below for more details.
- January 7, 2026: Anthropic as a Microsoft subprocessor becomes enabled on your tenant; the legacy admin toggle to opt-in to Anthropic's commercial terms and data processing agreement is deprecated.
 - If you previously opted in to the legacy Anthropic toggle, and you're in an excluded region, you would need to opt in to the new subprocessor toggle.
- Admins can opt out in MAC now - no need to wait until January.

Some features are only available when Anthropic models are enabled. If you turn off this option, certain features may no longer be accessible.

Nuovo processo nel Teams Desktop per gestione chiamate

(Updated) Upcoming Change to Teams Desktop Client on Windows

 Archive  Share  Copy link  Mark as unread

Summary

Thank you for the valuable feedback we've received. We are currently reassessing the rollout timelines to ensure alignment with your needs and operational requirements. You can expect a formal update from us by mid to late January 2026.

Is this summary helpful?  

Updated December 12, 2025: Thank you for the valuable feedback we've received. We are currently reassessing the rollout timelines to ensure alignment with your needs and operational requirements. You can expect a formal update from us by mid to late January 2026.

Introduction

We're improving the performance and startup time of calling features in the Microsoft Teams Desktop Client for Windows. To achieve this, we're introducing a new child process named `ms-teams_modulehost.exe` that will handle the calling stack separately from the main application process (`ms-teams.exe`). This change optimizes resource usage and enhances meeting experiences.

When this will happen:

Updated rollout timing will be announced in January 2026

FEATURE UPDATE

USER IMPACT

ms-teams_modulehost.exe

A new child process, **ms-teams_modulehost.exe**, will run alongside the primary Teams process **ms-teams.exe** and appear under it in Task Manager.

The new process will host the **calling stack** — audio, video, device enumeration, codec initialization, and the real-time communication (RTC) pipeline — separating those duties from chat, UI rendering, file handling, and other non-call features.

No user interface changes or workflow modifications are expected; the change is intended to be invisible to end users while improving meeting experiences.

Admins must **allowlist ms-teams_modulehost.exe** in endpoint protection/EDR/app-control tools and **duplicate QoS (DSCP) settings** currently applied to ms-teams.exe for the new executable (do not remove the existing QoS rules for ms-teams.exe).

Why process splitting matters

Teams' Windows desktop client uses the **WebView2 runtime**, which itself inherits a Chromium-style multi-process browser model: a browser process, one or more renderer processes, and helper processes for GPU, audio, and other services. WebView2 applications therefore already operate in a multi-process environment, and Teams has historically shown significant baseline memory and multiple helper processes tied to that runtime.

Microsoft's change extends that model by intentionally isolating the media/calling pipeline into its own host process.

Splitting the calling stack into **ms-teams_modulehost.exe** provides a number of engineering and operational benefits that are well-established in large, media-heavy applications:

Fault isolation: crashes or hangs in the media stack are contained to the child process and are less likely to take down the UI or chat flows.

Parallel initialization: the media stack can initialize independently of the UI, which can shorten perceived call startup times for users who join meetings quickly after opening the client.

Targeted resource control: OS schedulers, QoS classifiers, and network devices can target the media process for prioritization, shaping, or measurement without affecting the rest of the client.

All of these are standard architectural tactics used across browsers and modern communication clients to keep latency-sensitive subsystems isolated and more predictable under load.

Supporto al Classic Outlook fino, almeno, al 2029

<https://techcommunity.microsoft.com/blog/outlook/new-outlook-for-windows-a-guide-to-product-availability>

Stage 3: Cutover

In the cutover stage, the ability to switch back to classic Outlook will no longer be available to users. New deployments of Outlook from Microsoft 365 subscriptions will feature new Outlook for Windows. We will determine readiness for this stage in collaboration with customers, and will provide at least 12 months' notice before moving to this stage in Production rings. If needed, IT administrators can decide to move their organizations to this stage earlier than our production timeline.

Existing installations of classic Outlook for Windows through perpetual and subscription licensing will continue to be supported.

Please note that the cutover stage does not signify the end of support for classic Outlook for Windows. We will continue to honor published support timelines for existing version of classic Outlook for Windows until at least 2029.

Exchange Online ActiveSync device support update

ArchiveShareCopy linkMark as unread

Action required by Feb 28, 2026

Summary

Starting March 1, 2026, devices using Exchange ActiveSync versions below 16.1 cannot connect to Exchange Online. Organizations must update mobile devices and apps to EAS 16.1 or higher. Outlook Mobile and Exchange Server are unaffected. Admins can identify outdated devices via PowerShell and should inform users accordingly.

Is this summary helpful?

Exchange Online ActiveSync Device Support Update

We're making a change to improve security and reliability in Exchange Online. Starting **March 1, 2026**, devices using **Exchange ActiveSync (EAS)** versions lower than 16.1 will no longer be able to connect to Exchange Online. EAS 16.1 was introduced in June 2016 and provides enhanced compatibility and security.

When this will happen:

This change begins taking effect on **March 1, 2026**.

Update to EWS Access for Kiosk / Frontline Worker Licensed Users

The_Exchange_Team Platinum Contributor

Dec 02, 2025

Update 12/15/2025: We modified the date of this change to **end of June 2026** based on customer feedback. Please use that extra time to remove your dependencies on EWS.

As part of our ongoing efforts to [deprecate Exchange Web Services](#) (EWS), starting with end of June 2026, we will start to block EWS access for all mailboxes without license rights to EWS. This is another step in our ongoing commitment to enhance the security and control mechanisms of EWS.

The impacted licenses are:

- **Exchange Online Kiosk**
- **Microsoft 365 and Office 365 F1**
- **Microsoft 365 and Office 365 F3**

As stated in the [Service Descriptions](#), these licenses do not provide access to mailboxes via EWS, but these restrictions were never enforced. With this change, EWS access for users with only these license types will be blocked.

If you wish them to use EWS, and your users are licensed with one of these noted above, you'll need to assign a new license, one containing EWS access rights. For example, you could assign an Exchange Online Plan 1 or 2 license, or a Microsoft 365 or Office 365 E3 or E5 license.

Starting March 1, 2026, requests to use EWS without a suitable license will result in a *HTTP 403* response.

Nonprofit Pricing

The changes will apply globally with local market adjustments for our commercial products and nonprofit pricing will be adjusted in line with commercial pricing.⁶ In addition to commercial products, today we also announced changes to the Microsoft 365 Government Suites. Learn more in the [Government blog](#).
