Block files from opening with insecure protocols	At risk	Microsoft 365 apps
Block files from opening with FFRPC protocol	At risk	Microsoft 365 apps
Block legacy browser authentication connections to SharePoint	Meets standard	SharePoint
Block ID/CRL protocol connections to SharePoint	At risk	SharePoint
Don't allow new custom scripts in OneDrive and SharePoint sites	At risk	SharePoint
Remove access to Microsoft Store for SharePoint	At risk	SharePoint

Files (6)

OneDrive files deleted from the cloud will NO longer appear in the local Recycle Bin or Trash!

OneDrive files deleted from the cloud will NO longer appear in the local Recycle Bin or Trash!

To improve OneDrive sync performance and make file recovery more predictable, OneDrive will change how cloud-initiated file deletions are handled on local devices. When a file that is locally available on a device is deleted from the cloud, it will no longer appear in the local Recycle Bin on Windows or Trash on macOS.

Recovery will instead be available from the OneDrive or SharePoint web recycle bin, depending on where the file was stored.

This change improves sync performance for users with large file libraries, making delete operations faster and ensuring restores are simpler and more predictable with a single authoritative copy in the appropriate web recycle bin (OneDrive or SharePoint).

When this will happen:

General Availability (Worldwide, GCC, GCC High, DoD): Rolling out in early May 2026 and expected to complete by late May 2026.

How this affects your organization:

All OneDrive users on Windows and macOS.

No admin action is required.

What will happen:

- Files deleted from the cloud (OneDrive web or another device) that were locally available on the device:
 - Will be removed directly from the local disk.
 - Will not appear in the local Recycle Bin (Windows) or Trash (macOS).
 - Can be recovered from the OneDrive or SharePoint web recycle bin (for up to 93 days).
- Files that are cloud-only (Files On-Demand) are unchanged.
- Files deleted locally on the device will continue to appear in the local -Recycle Bin or Trash as they do today.
- There is no admin configuration or opt-out for this change.

Flex routing during peak load periods

Microsoft is silently rolling out “flex routing” in M365 Copilot.

During peak demand, Copilot can process prompts outside the EU.

What it does:

- Uses global capacity when EU is under pressure
- Keeps Copilot fast and responsive

What it does NOT do:

- Does NOT move your data permanently out of the EU
- Does NOT store data outside the EU

What actually changes:

- Processing (LLM inference) can happen outside the EU

What you need to know:

- It's enabled by default
- You can disable it
- It's a governance decision - not just a technical one

Doing nothing = accepting it.

Flex routing during peak load periods

Allow large language model (LLM) inferencing to occur outside the European Union (EU) Data Boundary during periods of peak demand to help maintain a consistent Copilot experience.

No matter where LLM inferencing occurs, data will be encrypted in transit and at rest. Data at rest will continue to be stored inside the EU Data Boundary, except for limited pseudonymized data which may be stored outside the EU Data Boundary for security and operational purposes.

[Learn more about this setting](#)

- ☒ Allow flex routing during periods of peak load
- ☐ Do not allow flex routing

Modernized Change Management for Microsoft 365

MC1282306

Live from April
2026

What is this change

Microsoft is overhauling how M365 updates are released and communicated. The goal is to give IT teams greater clarity, consistency, and control — especially as the pace of AI-driven innovation has outgrown traditional change management processes.

Current scope

This is the **first step** in a broader journey. Initially limited to **Microsoft 365 Copilot features**. Existing tools and methodologies continue to apply to all other workloads. Expansion to further services is planned.

GCC / GCC High / DoD

The new Standard and Deferred release channels are not yet available for sovereign cloud environments. Check documentation for updates.

The three pillars

1 — New release audience tiers

Frontier, Standard, and Deferred channels replace and extend Targeted Release for Copilot features.

2 — Restructured Message Center posts

Standardised headings with Impact, Required action, and Compliance considerations surfaced at the top of every post.

3 — AI-powered change insights

Two MCP Servers let AI clients query the public M365 Roadmap and your own tenant's Message Center in natural language.

Pillar 1 — New release audience tiers: Frontier, Standard, Deferred

MC1282306

Copilot only (for now)

Frontier

Early access to emerging AI capabilities before general availability. Opt-in. Admins can evaluate new Copilot agents and provide feedback directly to Microsoft.

Standard

The default channel. Features roll out at general availability on Microsoft's standard schedule. Equivalent to how most tenants receive updates today.

Deferred

Delayed rollout for regulated environments or cautious deployments. Moving users from Standard to Deferred may temporarily remove access to features not yet in that channel — notify users before switching.

Relationship to Targeted Release

The new tiers do **not replace** Targeted Release — they work alongside it. Targeted Release controls non-Copilot services; Frontier/Standard/Deferred controls Copilot. Microsoft calls this a “converged release strategy” going forward.

How to configure

- Admin Center → Org Settings → Release preferences
- Required roles: Office Apps Admin, Security Admin, or AI Admin
- New model applies to Copilot features from late May 2026

Not available for GCC, GCC High, or DoD environments.

Pillar 2: Message Center post structure updates (may require admin script changes)

MC1282308

Live from 16 May 2026

What is changing

Microsoft is standardizing all Message Center post section headings to deliver more consistent, actionable communications and enable future agentic experiences.

New heading examples

- "What and Why"
- "Rollout Schedule"

Who is affected

Admins and partners with **scripts or automation that parse Message Center posts by section heading**. Admins consuming posts only via the Admin Center UI or digest emails: no action needed.

Action required

Review any PowerShell scripts or tools that search for specific heading strings within Message Center post content. Update them to match the new standardized headings before 16 May 2026.

Typical use cases to check

- Graph API scripts parsing post body by heading
- Power Automate flows extracting sections from posts
- Planner/Teams connector syncing with section-based logic
- Third-party ITSM integrations reading post structure

UI-only and digest email consumers: no action needed.

Pillar 3 — AI-powered change insights via MCP Servers

MC1282306

Now available

MRC MCP Server (public roadmap)

The **Microsoft Release Communications (MRC) MCP Server** connects to the public M365 Roadmap and Azure Updates. Ask your AI client in natural language: “what is coming to M365 in the next 30 days?” and get a live answer based on current roadmap data.

MCP Server for Enterprise (your tenant)

Goes further — gives an AI agent **read-only access to your own tenant’s Message Center and Service Health Dashboard** via Microsoft Graph delegated permissions. Entra security, access controls, and compliance requirements stay in place.

The shift this enables

From **passively reviewing** service updates to **actively reasoning** over change data with AI.

What you need to use them

- An **MCP-compatible AI client**: Copilot in the Admin Center, Claude, or other MCP-enabled tools
- For the Enterprise server: delegated Graph permissions (read-only Message Center + Service Health)
- Entra security and compliance requirements are enforced automatically

Example queries you can ask

- “What M365 changes are rolling out in the next 30 days?”
- “Which Message Center posts require admin action this week?”
- “Is there anything in Service Health affecting Teams today?”

Both servers are available now. Connect via Admin Center or MCP-compatible client.

MCP Server for Enterprise — powerful concept, early-stage reality

MC1282306

Early stage

What it actually does

Gives an MCP-compatible AI client **read-only access to your tenant's Message Center and Service Health Dashboard** via Microsoft Graph delegated permissions. The AI can only see what the signed-in user could already see in the admin portal.

Where it genuinely helps

- High post-volume tenants where AI can triage and prioritize for you
- Cross-referencing Message Center posts with live Service Health in one query
- Consultants managing multiple tenants: faster briefing across clients without switching portals

Honest assessment

The **concept is solid**, the **tooling works**, but the **productive day-to-day workflow patterns are still being figured out**. Right now it is closer to a well-built demo than a mature operational tool.

What is still missing

- No plug-and-play setup for end users — requires MCP client configuration and Graph consent by an admin
- If you already manage Message Center well, the AI layer adds modest efficiency gain today
- Multi-tenant querying (across several client tenants in one session) not yet supported

Worth setting up and experimenting with — not worth redesigning your change management process around yet.

Recover with Confidence—Minimize Downtime and Protect Your Tenant

Entra Backup and Recovery solution enables you to quickly recover from malicious attacks or accidental changes by reverting your core tenant objects to any previous state. With automated backups and granular recovery capabilities, it ensures minimal downtime and supports your business continuity in the face of unexpected disruptions.

Entra automatically generates one backup per day, retaining the last 5 days of backup history. You can recover key properties of the following core tenant objects: users, groups, roles, access policies, service principals, organization, authentication methods, authorization policy, and named locations. M365 and Microsoft Teams: Unified management of app and availability in Teams, Outlook, and the Microsoft 365 app

Summary

Microsoft is unifying app and agent availability management across Teams, Outlook, and Microsoft 365 admin centers to ensure consistent policies. The rollout starts September 2025 and completes by August 2026 in phases, including tools to resolve discrepancies and synchronized settings across platforms for streamlined administration.

Before this rollout, managing Teams apps that also work in Outlook and the Microsoft 365 app was fragmented across two admin centers:

- the Integrated apps and Agent apps pages in the Microsoft 365 admin center, and
- the Manage apps page in the Teams admin center.

This sometimes resulted in inconsistent availability settings for the same app.

With Unified agent app management, admins can manage apps and agents from either the Microsoft 365 admin center or the Teams admin center. Availability settings will remain synchronized across both, ensuring a consistent management experience.

What you can expect:

- You'll gain a consolidated view of agent and Microsoft 365 app availability across both Microsoft 365 and Teams admin centers
- Changes made in either admin center to the agent and app availability will automatically apply across all supported hosts
- Organization-wide defaults for both admin centers will be in sync and govern app availability across Teams, Outlook, and the Microsoft 365 copilot app.

NEW FEATURE

Project Glasswing — AI vulnerability research and what it means for M365 security

Project Glasswing

April 2026

What is Project Glasswing

A coalition of Anthropic, Microsoft, AWS, Google, CrowdStrike and Palo Alto Networks built around **Claude Mythos Preview**, a frontier AI model that has already found thousands of high-severity vulnerabilities across every major OS and browser, surpassing all but the most skilled human experts.

The Microsoft angle

Microsoft is a founding partner. Mythos Preview was benchmarked against **CTI-REALM**, Microsoft's open-source security benchmark, showing substantial improvements. Access will be available via **Microsoft Foundry**, woven directly into the Microsoft platform ecosystem.

The threat landscape has shifted

The window between a vulnerability being discovered and being exploited has collapsed. What once took months **now happens in minutes** with AI-assisted attacks.

What this means for your M365 clients

Every security configuration gap in a tenant is now higher-risk. The work you are already doing is more urgent, not different.

Review in every tenant

- MFA coverage gaps — trusted location exclusions are now high-risk loopholes
- Defender AIR pipeline — suppression rules blocking automated investigations must be cleared
- Conditional Access hardening — no partial coverage assumptions
- Intune device compliance — non-negotiable baseline, especially for BYOD

Glasswing validates the security work you are already doing and raises the cost of gaps.

Planner nei canali Privati e Condivisi di Teams

(Updated) Planner tab support for Shared and Private Channels in Microsoft Teams

 Archive  Share  Copy link  Mark as unread

Summary

Microsoft Planner tabs will be available in Microsoft Teams Shared and Private channels starting mid-May 2026, allowing users to create or add plans with inherited channel permissions and compliance. The feature is enabled by default, requires no admin setup, and supports basic plans initially, with premium features coming later.

Is this summary helpful?  

Updated March 31, 2026: We have updated the content. Thank you for your patience.

Introduction

We are expanding Microsoft Planner integration in Microsoft Teams by enabling **Planner tabs in Shared and Private channels**. This change allows teams to plan and track work directly within the channel where collaboration occurs, including scenarios that require restricted membership or cross-organization collaboration.

Only basic plans are being made available in Shared and Private Channels. Premium capabilities will come at a later date.

When this will happen:

General Availability (Worldwide): Rollout begins **mid-May 2026** and is expected to complete by **late May 2026**.

Test your mic and speaker before you join a meeting

For that first meeting of the day - Test your mic and speaker before you join a meeting

This is one of those small features that I think people will appreciate

From the pre-join screen, you'll be able to:

- Record a short audio clip of yourself
- Play it back instantly
- Confirm the right devices are selected before you join

- No more can you hear me?
- No more joining with the wrong mic.
- No more is it you or me?

Currently in development, rolling out from May 2026.

Microsoft Teams: Test your microphone before you join

■ □ □ IN DEVELOPMENT

Microsoft Teams

ROLLOUT START
May 2026

Before joining a meeting on your pre-join screen, you can test your microphone and speaker to make sure others will hear you clearly. Select Test mic and speaker to record a short audio clip and play it back. This helps you confirm that the right devices are selected and that you'll be heard—and hear others—once the meeting starts.

Queues app on Microsoft Teams mobile

Archive Share Copy link Mark as unread

Summary

The Queues app on Microsoft Teams mobile (iOS and Android) will allow calling representatives and supervisors to manage call queues, view queue details, and call history on the go. Rolling out worldwide from mid- to late May 2026, it is enabled by default for licensed Teams Phone and Teams Premium users.

Is this summary helpful?  

Introduction

The Queues app on Microsoft Teams mobile (iOS and Android) allows calling representatives and supervisor leads to manage call queues and handle customer calls while away from their desks. This update extends existing Queues functionality to the Teams mobile app, enabling users to manage queue participation and review call activity from a mobile device.

This message is associated with Microsoft 365 Roadmap ID [559386](#).

Microsoft Teams: Ad-hoc room reservation from Teams Rooms on Windows console

Summary

Microsoft Teams Rooms on Windows will support ad-hoc room reservations directly from the console starting early June 2026, requiring a Teams Rooms Pro license.

The feature is enabled by default, allows quick room booking with 15-minute increments, and includes admin controls for management and restrictions.

Introduction

We're introducing ad-hoc room reservation directly from the Microsoft Teams Rooms on Windows console.

This update enables users to reserve an available room on the spot without relying on a personal device or hallway panel, supporting quick, spontaneous meetings and helping reduce scheduling conflicts.

This feature requires a Teams Rooms Pro license.

This message is associated with Microsoft 365 Roadmap ID [548648](#).

Personal Assistant

Now in **Frontier**. AI answers on your behalf, filters spam, gathers context, and can schedule follow-ups via Bookings. Admin reporting newly in TAC.
Out-of-office aware.
Priority access list, custom greetings, language selection, test calls.
Mobile experience coming.

DLP: restrict Copilot from processing content

New DLP control for Copilot web search

- DLP policy creation will include a new option to restrict Copilot from performing external web searches when a prompt contains selected SITs.

When triggered, Copilot:

- Will not send content to external web search.
- Will continue responding using internal Microsoft Graph data sources, if licensing allows.
- Public Preview: Rollout began in late March 2026 and completes in late April 2026.
- General Availability: Rollout begins in late May 2026 and completes in late June 2026.

Ritiro del report "Top domain MailFlow" in EAC

Top domain mail flow report in Exchange Online is retiring

Archive Share Copy link Mark as unread

⚠️ Action required by Jul 5, 2026

Summary

The Top domain mail flow report in Exchange Online's Exchange admin center will retire on July 6, 2026. After this, it will be inaccessible, requiring admins to adopt alternative reporting methods. No other mail flow reports or mail delivery behaviors are affected. Prepare by updating documentation and validating new workflows.

Introduction

We're retiring the Top domain mail flow report in the Exchange admin center (EAC) in WW. This change is part of our ongoing work to streamline and modernize mail flow reporting in Exchange Online, helping admins consolidate workflows and adopt more flexible reporting options.

When this will happen

The Top domain mail flow report will be retired on July 6, 2026.

Disabilitazione Exchange Web Services in ExchangeOnline

Action Required: Update active Exchange Web Services Applications

Archive Share Copy link Mark as unread

In 2018, we announced that we were no longer making feature updates to Exchange Web Services (EWS) in Exchange Online, and we advised developers to move to Microsoft Graph.

In September 2023, we announced that on October 1, 2026, we will start blocking EWS requests to Exchange Online.

We are now less than 12 months from October 1, 2026. We have made progress on closing most parity gaps with more changes in development to be released in the coming quarters. Please refer to Deprecation of Exchange Web Services in Exchange Online for up-to-date guidance and roadmap information.

You are receiving this notification because there are EWS applications in your tenant.

If you haven't already, start the process of working with your application development organization and your application vendors to either sunset or migrate active EWS applications on your tenant to the Graph API, Power Platform, or Copilot Declarative Agents.

The vast majority of custom EWS applications can be safely migrated to alternative technologies today.

When this will happen:

October 1, 2026

Microsoft Defender for Office 365: Enhancing how we handle promotional mail

 Archive  Share  Copy link  Mark as unread

Summary

Microsoft Defender for Office 365 will tag promotional emails as "promotions" and can auto-move them to a Promotions folder, learning from user actions to improve sorting. Rollout begins **mid-April 2026 (preview)** and **July 2026 (general availability)** worldwide, affecting all tenants with configurable admin controls.

Is this summary helpful?  

Introduction

We are enhancing how **Microsoft Defender for Office 365** identifies and manages promotional email. Promotional messages will be tagged as "promotions" (previously "Bulk" in preview) and can be moved automatically to a new Promotions folder. The system learns from user actions, such as moving messages into or out of the **Promotions folder** and applies those preferences to future messages. These improvements reduce inbox clutter and help users stay focused while still receiving promotional content they want.

When this will happen

- **Public Preview (Worldwide):** We will begin rolling out in **mid-April 2026** and expect to complete by **late April 2026**.
- **General Availability (Worldwide):** We will begin rolling out in **early July 2026** and expect to complete by **late July 2026**.

MAJOR UPDATE

ADMIN IMPACT

NEW FEATURE

USER IMPACT

High Volume Email for Microsoft 365 is now Generally Available!

Exchange Online includes email-sending limits based on three factors:

- Recipient rate limit
- Recipient limit
- Message rate limit

To support customers whose internal communication needs exceed these standard limits, Microsoft is introducing High Volume Email (HVE) for Microsoft 365.

HVE is designed for large-scale internal communications and integrates with business applications and devices to support operational and mass-mailing scenarios. It uses a transactional pricing model based on the number of recipients.

Currently, HVE is available at no additional cost. However, usage will be metered starting June 1, 2026, based on the number of expanded email recipients, with pricing set at \$42 per one million recipients through Microsoft commerce (equivalent to \$0.000042 per one recipient).
